Web-d Workshop

Web development ranges from developing a single static page of plane text to complex web-based applications, electronic businesses and social network services. It usually refers to the main non-design aspects of building websites, writing markups and coding. Front-end web developers are responsible for how a website looks, they create site layouts and integrate graphic applications such as a retail checkout tool and other content. A backend developer creates the logical back-end and core computational logic of a website. He/she is responsible for creating features that are indirectly accessed by a user through a front end system. In practice web developers have to explore roles like -

- Graphic design.
 - Information architecture.
 - Web usability and search engine optimisation.
 - Mobile responsiveness.
 - Security considerations and testing.
-
